## 1.3way of communication

### 1.3.1Standalone mode

cell phoneAPPConnect to the battery packBMSBluetooth, using a question-and-answer interactive mode, the mobile phone sends commands toBMS,BMS After receiving the command, response information is returned via Bluetooth.

BMSBoard received the mobile phoneAPPAfter the command, response information is returned. If the mobile phone is5sUnable to adductBMSIf the board's response information or received response information is incorrect, it is considered that this communication failed.3After several failures,APPTThe page prompts that the connection is abnormal.

### 1.3.2Parallel mode

When running in parallel, the Bluetooth device name of each battery pack is set toBPxx(xxwith battery packBMS The decimal numbers corresponding to the dialing addresses are the same.BP00~BP15) .

cell phoneAPPChoose from different battery packsBMSBluetooth connection to achieve communication with different battery packs.

APPParallel mode can select the hostBP00The summary display can also achieve individual display of each battery pack by

switching the target device name.

## 2. Information structure

In order to ensure that information can beBMSThe information is transmitted accurately to and from the mobile phone, and the information is organized according to a certain structure to express1The information structure is given.

Information consists of many bytes. One or more bytes form a unit, which has a name and expresses a certain meaning. surface2It's a table1Notes for each unit, table3It's a table2middleCIDFurther notes on, table3,surface4It's a table2 middleCID,RTNFurther comments.

surface1-Data frame structure table

data	SOI	VER	ADR	REQ CID	CID RTN	LENGTH	DATA	CRC	EOI
content	7EH	/	/	/	/	/	/	/	0DH
byte number	1	1	1	1	1	2	LENGTH	2	1

surface2-Data frame structure annotation

data	meaning	Remark
SOI	Start character: indicates the beginning of a data frame	Fixed value:7EH(~)
VER	Protocol version: Bluetooth communication protocol version	Request value: fixed value10H Return value: variable value

<b>ADR</b>	Address code: device address identification code	Variable value:00H~FFH
<b>REQ/CID</b>	REQ:Command request CID:REQReturn value, return the corresponding function code	Fixed value:46H See table for details3
<b>CID/RTN</b>	CID:function code RTN: function return code	See table for details3 See table for details4
<b>LENGTH</b>	Length code: data informationDATANumber of bytes	Variable value:0000H~FFFFH
<b>DATA</b>	Data content:BMSwith mobile phoneAPP Interactive data (i.e.:PAYLOAD)	The length isLENGTHbytes
<b>CRC</b>	CRCCheck code: adoptedcrc16-xmodemcheck	For details on verification methods, see3.3
<b>EOI</b>	Terminator: indicates the end of a data frame	Fixed value:0DH(CR)

surface3-CIDfunction code

serial number	CID(function code)	meaning
1	47H	ObtainBMSPParameter information
2	51H	Get device manufacturer information
3	61H	Get single machine data
4	62H	Get parallel data
5	63H	switchCANprotocol
6	64H	switch485protocol
7	A1H	set upBMSPParameter information (protection switch)
8	65H	Set device group number and name
.....	.....	.....

surface4-RTN(CIDreturn code)

serial number	RTN(CIDreturn code)	meaning
1	00H	normal
2	01H	VERmistake
3	02H	CRCCheck error

4	03H	Data length error
5	04H	CIDinvalid
6	05H	Command format error
7	06H	Invalid data
8	07H	No data (history)
9	E1H	REQinvalid
10	E2H	Command execution failed
11	E3H	Equipment failure
12	E4H	Invalid permissions

surface5-Data conversion table

serial number	data	Conversion method
1	Cell voltage	unsigned integer, unitmV, actual value = transmission value For example:0x0CD9=3289mV
2	temperature	unsigned integer, unit0.1℃, actual value = (transmission-2731)/10 For example:0x0BD8=3032express(3032-2731)/10(℃)=30.1℃
3	total current	signed integer, unitA, actual value = transmission value /100 For example:0x1194=4500express45.00A
4	total voltage	unsigned integer, unitV, actual value = transmission value / 100 For example:0x1518=5400express54.00 V
5	capacity	unsigned integer, unitAh, actual value = transmission value /100 For example:0x12DE=4830express48.30Ah

### 3. Data format

#### 3.1Data transfer format

Data information is transmitted in hexadecimal. Please refer to the relevant table for the content represented by the data part.

#### 3.2 CRCCheck byte format

CRCThe check byte is calculated usingCRC-16/XMODEMCheck word calculation program, divide the command frameSOI,  
EOland CRCExcept for bytes, the rest of the data is calculated16bit unsigned integer data,CRCWhen transmitting check bytes, first

Transmit the high byte and then the low byte.

### 3.3 CRC-16/XMODEMCheck word calculation program

```
1.  uint16_t  crc_16_xmodem(uint8_t *Data, uint16_t len)
2.  {
3.      uint8_t  i      = 0 ;
4.      uint16_t  crc16  = 0x0000 ;
5.
6.      while(len--)
7.      {
8.          for(i  =0x80 ; i != 0 ; i >>= 1 )
9.          {
10.             if((crc16 & 0x8000) != 0)
11.             {
12.                 crc16 = crc16 << 1 ;
13.                 crc16 = crc16 ^ 0x1021 ;
14.             }
15.             else
16.             {
17.                 crc16 = crc16 << 1 ;
18.             }
19.             if((*Data & i) != 0 )
20.             {
twenty one.                 crc16 = crc16 ^ 0x1021 ;
twenty two.             }
twenty three.         }
twenty four.         Data++;
25.     }
26.     return  crc16;
27. }
```
